An aerial photograph showing a city with a large forested area on the left and a dense urban area on the right. The forest is a dark green, while the city is a mix of grey, brown, and green. A highway is visible in the upper right. The text is overlaid on the image.

# Urban Influences on Forest Ecosystems

by  
Wayne C. Zipperer  
USDA Forest Service

# Urban Influences

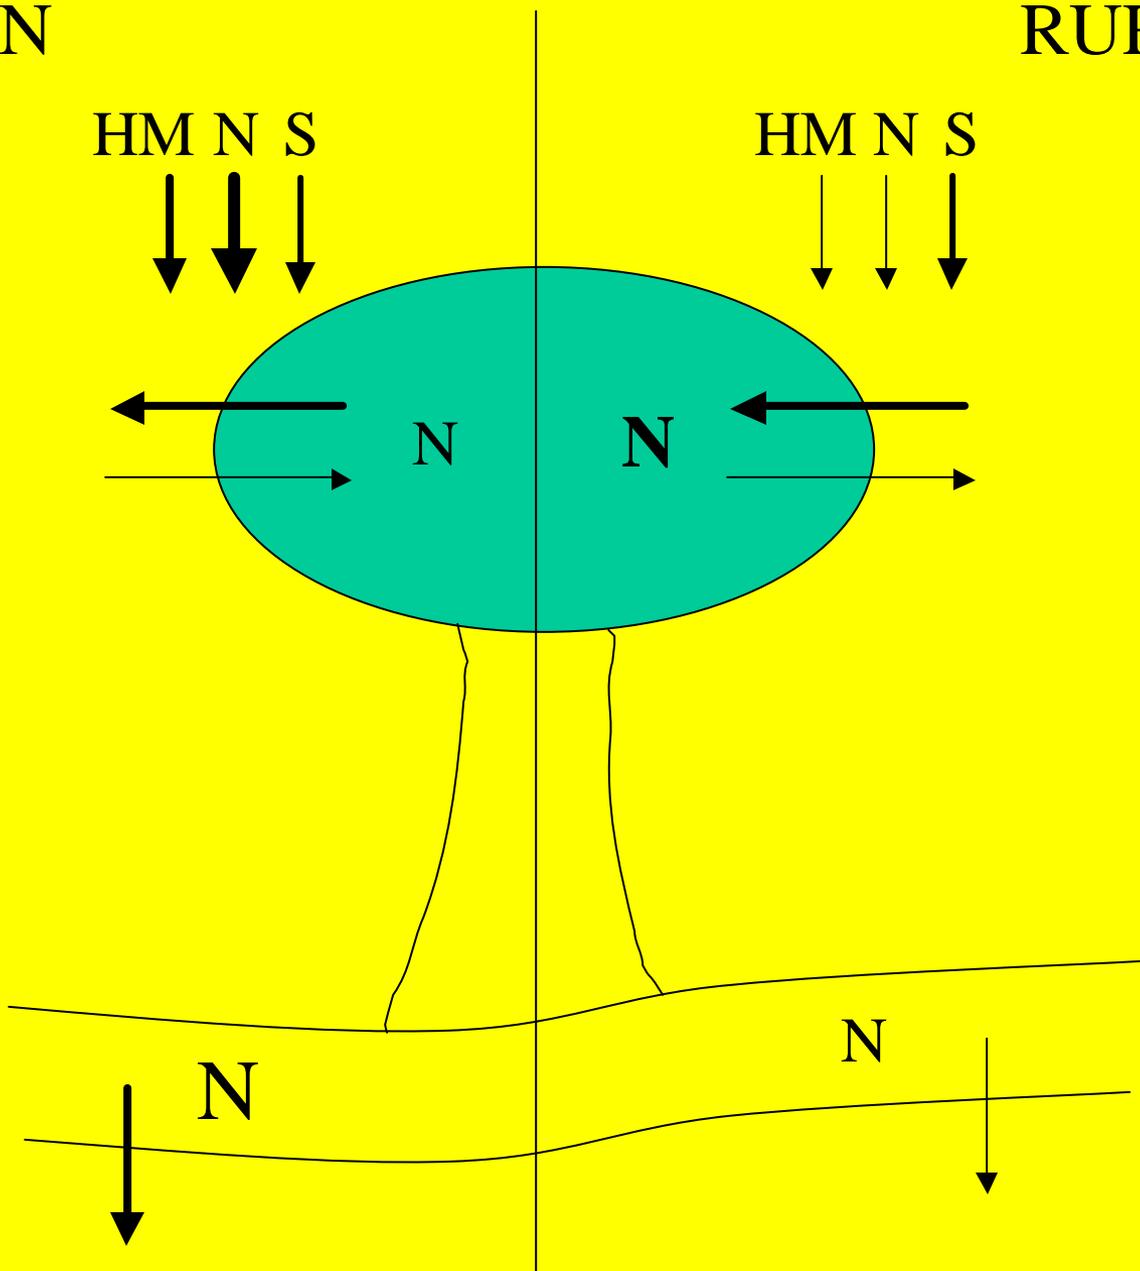

- Direct Influence
  - Land conversion
- Indirect Influence
  - Modifying nutrient cycles
  - Modifying hydrology
  - Introducing non-native species
  - Modifying disturbance regime
  - Changing atmospheric

Tree canopy losses in selected areas in the South as reported by American Forests.

Location	Tree-covered area (1000 acres)	Duration (yr)	Canopy loss (%)
Atlanta Metropolitan area	1747	1974-1996	26
Chattanooga, TN	110	1974-1996	21
Houston Metropolitan area	692	1972-1999	8
Roanoke, VA	313	1973-1977	9
Fairfax County, VA	125	1973-1997	20

The effect of different percentages of impervious surface on stream stability, water quality, and biodiversity (from Schueler (1994)).

Stream Attributes	Impervious surface (%)		
	0-10	11-25	25-100
Stream stability	Stable	Unstable	Highly unstable
Water quality	Good	Fair	Fair-poor
Stream biodiversity	Good-excellent	Fair-good	Poor

An aerial photograph of a city, likely San Francisco, showing a dense urban area with skyscrapers and a network of roads. In the upper left, a large, dark green forested area is visible, contrasting with the urban landscape. The image serves as a background for the text.

Through modifying the following factors, urbanization increases the susceptibility of a forest to colonization by non-indigenous species and native generalists.

- Modifying soils
- Altering disturbance regime
- Reducing predator species
- Simplifying food webs
